

ABSTRACT OF THE DISCLOSURE

A device for controlling functions of a microscope is disclosed, the microscope system encompassing a stand base part (3). A central display (8) is integrated into the stand base part (3). The display (8) contains an operating menu (20) and an information mode (25), the operating menu (20) being constructed from a first region (211), a second region (221), and a third region (222). A main menu (21) is displayable in the first region (211), a submenu (22) in the second region (221), and information and action elements in the third region (222), the third region (222) being delimited on one side by the main menu (21) and on one side by the submenu (22), and the entire display (8) being usable for presentation in the information mode (25).
